

weighted & ratio 1d multi tickers - v2

2026-04-29 19:26:12

Research Question

compare the 1d forward return using `zscore_oi_above_below_ratio_3m` and `zscore_oi_weighted_strike_all_div_spot_3m` for a collection of tickers. Do you have flexibility to provide in the visuals, something showing average return % for key decile(s) across all tickers?

Tickers: AAPL, ADBE, AMZN, GOOGL, INTC, META, MSFT, NFLX, NVDA, SPY, TSLA

Table: daily features

Findings Summary

OI-Implied Signal Comparison: `zscore\_oi\_above\_below\_ratio\_3m` vs. `zscore\_oi\_weighted\_strike\_all\_div\_spot\_3m` ###
1-Day Forward Return Decile Analysis | Cross-Ticker

— — —

Executive Summary

Across the tested universe, `** zscore_oi_above_below_ratio_3m **` is the stronger OI-implied signal: it produces a wider D10–D1 spread, cleaner monotonic gradient, and higher cross-ticker consistency than ``zscore_oi_weighted_strike_all_div_spot_3m``. Both signals are **negatively oriented** — high z-score readings predict lower next-day returns, and low z-score readings predict elevated returns — but the above/below ratio signal does so with materially better linearity and per-ticker reliability.

Visual Framework

Figure 1 — Pooled Decile Bar Charts (Side-by-Side)

Full Bucket Profile Analysis

Signal A: `zscore\_oi\_above\_below\_ratio\_3m`

The SPY profile (score=93) is the cleanest in the dataset. D1 prints +0.43% with an 82.4% win rate and Sharpe of 0.82 — a rare combination of magnitude and reliability. The decay from D1 through D4 is near-linear (+0.43%, +0.26%, +0.16%, +0.05%), then the middle buckets (D5-D8) compress into a flat band (-0.04% to +0.10%). The signal reasserts in D9 (-0.15%) and culminates at D10 (-0.70%, 27.2
